# 1 Introduction

## 1.1 Purpose

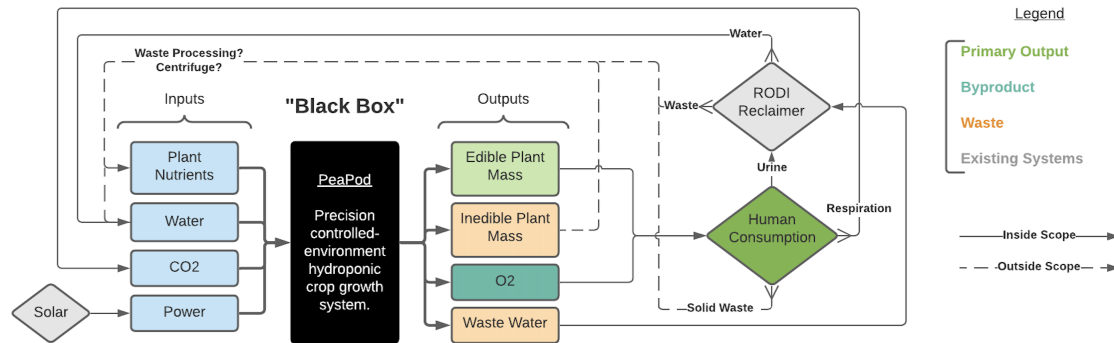

The purpose of this document is to outline the function and features of a proposal to the PeaPod Design Brief.

It accomplishes this by answering the following questions on a recursively-scoping basis:

1. **What** is the design? What does it accomplish/what is its function?
2. **How** does it accomplish this? What are its features?
3. **Why** that functionality? Why that way?

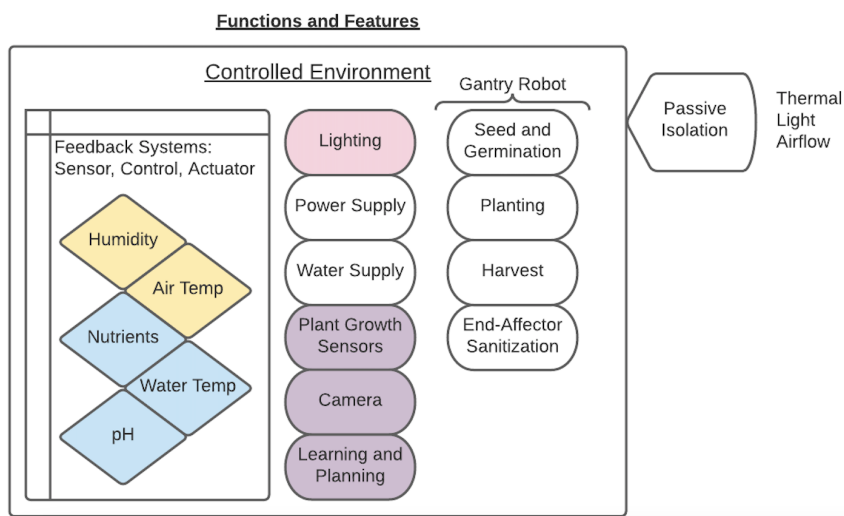

## 2 Design

Functions of the design are derived from the input and output requirements.

Features of the design are developed to meet the function, and are derived from the opportunity statement:

PeaPod is "an automated and isolated aeroponic crop growth system, able to generate any environment from a combination of independent environment parameters, with both environment and crop growth data collection".

## 2.1 Automation

**What:** Performing growth-, maintenance-, and data-related tasks autonomously on the basis of both schedule and necessity.

**How:**

- Schedule:
  - User inputs time/action pairs;
  - E.g. Water at 08:00, Turn light to setting X at 14:00;
  - *Bonus:* Can notify user if action's resource is missing (i.e. water tank low)
- Necessity:
  - "Sense, Plan, Act" robotics/control model:
    1. *Senses* current conditions;
    2. *Plans* a path to desired condition;
    3. *Acts* to change current condition to desired condition;

**Why:** Increased accuracy/precision over human interference, minimize human hours spent.

## 2.2 Isolation/Insulation and Housing

**What:** Isolates the growth environment from the exterior environment, provides structural integrity and mounting points.

**How:** Cube exoskeleton (aluminum extrusion) holds solid (acrylic/foam/corrugated board) internally-reflective (mylar) panels in place and aids in mounting plant growth platforms, lights, etc.

**Why:** Increases thermal and light efficiency. Isolation increases safety against cross-contamination, pathogens, harmful substances. Simple and strong construction with dedicated mounting channels.

## 2.3 Aeroponics

**What:** Medium-free growing method that uses nutrients dissolved within atomized water.

**How:** High-pressure (pump-tank-switch system) nozzles deliver atomized ( $\approx 50$  micron droplet) nutrient solution to plant roots. Parallel distribution topology (T-quick-connects at every unit height, solenoid ball valves at tank out and in each tray).

**Why:** No water parameter feedback, 98% more water efficient, minimizes pathogens and waste water.

## 2.4 Environment Control

The environment control feature can be broken up into **control systems** (2.4.1-2.4.3; sometimes in two parts) and **set systems** (2.4.4-2.4.7).

### 2.4.1 Air Temperature

**What:** Maintaining desired air temperature within the enclosure.

**How:** Thermoelectric heating/cooling system (peltier tiles w/ polarity switch, 'dimming' current control, PID) on a heat sink w/ fan, feedback from distributed temp sensors

**Why:** TECs have better space and energy efficiency, less complexity (no liquids, pressurized fluids, etc.), better control vs other methods. PID provides best control.

### 2.4.2 Air Humidification

**What:** Adding water vapour to air.

**How:** Ultrasonic nebulizer (piezo disc w/ custom driver circuit), RO water

**Why:** Piezo for droplet size, commonly used; RO for purity of water vapour

### 2.4.3 Air Dehumidification

**What:** Absorbs water vapour from the air.

**How:** Silica gel bead cartridges with fans/valves to control airflow across.

**Why:** Non-toxic, safe, cheap, effective. Color-changing indication at saturation, easily reset by baking and recapturing water.

### 2.4.4 Solution Temperature

**What:** Maintaining desired water temperature within the water store.

**How:** Same as 2.4.1; on a water block

**Why:** Same as 2.4.1

### 2.4.5 Solution Nutrients

**What:** Precisely dosing the correct amount of various nutrients ( $K^+$ ,  $NO_3^-$ , etc.) to the water system at setup/water addition.

**How:** Syringe-like dosage via servo motor to set ppm based on fill volume.

**Why:** Syringe dosage is precise, easy to refill.

### 2.4.6 Solution pH

**What:** Precisely adds pH up/down solutions to set the solution pH at setup/water addition.

**How:** Same as 2.4.5.

**Why:** Same as 2.4.5.

### 2.4.7 Lighting

**What:** Wide spectrum precision LED lighting targeting PAR.

**How:** N LED series/colors, N controlled-current PWM drivers, M LEDs per series = NxM LEDs.

Custom LED boards wired in series, one power board per tray, w/ diffusion.

**Why:** LED > every other type in every way, PWM easy protocol, CC because they're LEDs.
